## CAT 2020 Slot 1 QA

1. If $\log _{4} 5=\left(\log _{4} y\right)\left(\log _{6} \sqrt{ } 5\right)$, then $y$ equals $\qquad$ .
A
40

B $\mathbf{3 6}$

C $\quad 30$

D 50

## Solution

$$
\begin{aligned}
& \log _{4} 5=\left(\log _{4} y\right)\left(\log _{6} \sqrt{ } 5\right) \\
& \Rightarrow \frac{\log 5 \times \log 6}{\frac{1}{2} \log 5}=\log y \\
& \Rightarrow 2 \log 6=\log y \\
& \Rightarrow \log 6^{2}=\log y \\
& \Rightarrow y=36
\end{aligned}
$$

2. An alloy is prepared by mixing three metals $A, B$, and $C$ in the proportion 3:4:7 by volume. The weights of the same volume of the metals $A, B$, and $C$ are in the ratio 5:2:6. In 130 kg of the alloy, the weight (in kg ) of the metal C is .
A 96 kg

B $\quad \mathbf{8 4} \mathbf{~ k g}$

C $\quad 70 \mathrm{~kg}$

D 48 kg

## Solution

Ratio of volumes of $\mathrm{A}, \mathrm{B}, \mathrm{C}$ in the Alloy $=3: 4: 7$
Ratio of weights of the same volumes or density of $A, B$, and $C=5: 2: 6$
Ratio of weights of $\mathrm{A}, \mathrm{B}$, and C in the alloy $=3 \times 5: 4 \times 2: 7 \times 6=15: 8: 42$

|  | Volume | Density | Weight |
| :--- | :--- | :--- | :--- |
| A | 3 | 5 | 15 |
| B | 4 | 2 | 8 |
| C | 7 | 6 | 42 |

|  | Volume | Density | We |
| :--- | :--- | :--- | :--- |
| Overall | 14 | $\frac{65}{14}$ | 65 |

Total weight of alloy $=130 \mathrm{~kg}$
Weight of metal $C=\frac{42}{15+8+42} \times 130=84 \mathrm{~kg}$
3. Leaving home at the same time, Amal reaches his office at 10:15 a.m. if he travels at $8 \mathrm{~km} / \mathrm{h}$, and at $9: 40 \mathrm{am}$ if he travels at $15 \mathrm{~km} / \mathrm{h}$. Leaving home at 9:10 a.m., at what speed (in $\mathrm{km} / \mathrm{h}$ ) must he travel so as to reach office exactly at 10 a.m.?

A 13

B 14

C 11

D 12

## Solution

Let the distance between home and office be d km.
According to the question, we can write the following:
$\backslash(\backslash \operatorname{frac}\{\mathrm{d}\}\{8\}=\backslash \operatorname{frac}\{\mathrm{d}\}\{35\} \backslash)$
$=>\backslash(\backslash \operatorname{frac}\{7 \mathrm{~d}\}\{120\}=\backslash \operatorname{frac}\{35\}\{60\} \backslash)$
$\Rightarrow \mathrm{d}=10 \mathrm{~km}$

Now he should reach the office in 50 min .
$\mathrm{d}=10 \mathrm{~km}$
$\mathrm{t}=50 \mathrm{~min}=\backslash((\operatorname{frac}\{5\}\{6\} \backslash) \mathrm{h}$
Required speed $=\backslash(\backslash$ frac $\{10\}\{\backslash$ frac $\{5\}\{6\}\}=12 \backslash) \mathrm{km} / \mathrm{hr}$
4. Let $A, B$, and $C$ be three positive integers such that the sum of $A$ and the mean of $B$ and $C$ is 5 . In addition, the sum of $B$ and the mean of $A$ and $C$ is 7 . Then, the sum of $A$ and $B$ is $\qquad$ .

## A 4

B 5

C 7

D 6

## Solution

The given equations are the following:
$\backslash(\mathrm{A}+\backslash \operatorname{frac}\{\mathrm{B}+\mathrm{C}\}\{2\}=5 \backslash \backslash=>2 \mathrm{~A}+\mathrm{B}+\mathrm{C}=10 \backslash)$
$\backslash(\mathrm{B}+\backslash \operatorname{frac}\{\mathrm{A}+\mathrm{C}\}\{2\}=7 \backslash \backslash=>\mathrm{A}+2 \mathrm{~B}+\mathrm{C}=14 \backslash)$
Subtracting equation (1) from equation (2), we get the following:
$\mathrm{B}-\mathrm{A}=4$

Putting $A=1$, we will get $B=5$; this is the minimum value of $B$.
If $A=C=1$, then, from (1), we will get $B=6=\max$ value of $B$
But for $\mathrm{A}=1$, we were already getting $\mathrm{B}=5$.
Hence, $\mathrm{A}=\mathrm{C}=1$ is not possible.
$\Rightarrow 2 \mathrm{~A}+\mathrm{B}+\mathrm{C}=10$

From this, by putting $\mathrm{A}=1$ and $\mathrm{B}=5$, we get $\mathrm{C}=3$
So, the only possible solution is $\mathrm{A}=1, \mathrm{~B}=5$, and $\mathrm{C}=3$.
Therefore, $\mathrm{A}+\mathrm{B}=6$

## 5. A solid right circular cone of height 27 cm is cut into two pieces

 parallel to its base at a height of 18 cm from the base. If the difference in volume of the two pieces is 225 cc , the volume, in cc, of the original cone is $\qquad$A
256

B 232

C 264

D 243

## Solution

Height of original cone $=27 \mathrm{~cm}$
Height of smaller cone $=27-18=9 \mathrm{~cm}$
Ratio of height of original cone and smaller cone $=27: 9=3: 1$
Typeseting mbluing the similarity of triangles, we get the following:

The ratio of the radius of original cone to that of the smaller cone is $\backslash(\backslash \operatorname{frac}\{\mathrm{R}\}\{\mathrm{r}\}=\backslash \operatorname{frac}\{3\}\{1\} \backslash)$
Ratio of volumes $=\backslash\left((\backslash \operatorname{frac}\{3\}\{1\})^{\wedge} 3 \backslash\right)=((\operatorname{frac}\{27\}\{1\} \backslash)=27: 1$
Let the volume of the original cone be 27 k .
And the volume of the smaller cone $=\mathrm{k}$
Volume of frustum $=(27-1) \mathrm{k}=26 \mathrm{k}$
Given,
$26 \mathrm{k}-\mathrm{k}=225$
$25 \mathrm{k}=225=9 \times 25$
$\Rightarrow \mathrm{k}=9$
Volume of original cone $=27 \mathrm{k}=27 \times 9=243 \mathrm{cc}$
6. Two persons are walking beside a railway track at respective speeds of 2 and 4 km per hour in the same direction. A train came from behind them and crossed them in 90 and 100 seconds, respectively. The time, in seconds, taken by the train to cross an electric post is nearest to _.

A $\quad 78$

B $\mathbf{8 2}$

C 87

## D $\quad 75$

## Solution

Let the length of the train be $x$ metres and the speed of the train be $\mathrm{skm} / \mathrm{h}$.

As they are moving in the same direction, relative speed between the train and the first person $=(\mathrm{s}-2) \mathrm{km} / \mathrm{h}$

Similarly, relative speed between the train and the second person $=(s-4)$ $\mathrm{km} / \mathrm{h}$ [because they are moving in the same direction]

Since the distance (length of train) is same in both the cases, we can write the following:
$\backslash\left(\mid \operatorname{frac}\left\{S_{-} 1\right\}\left\{S_{-} 2\right\}=\backslash\right.$ frac $\left.\left\{T \_2\right\}\left\{T_{-} 1\right\} \backslash\right)$

```
\(\backslash(=>\backslash\) frac \(\{\mathrm{S}-2\}\{\mathrm{S}-4\}=\backslash \mathrm{frac}\{100\}\{90\} \backslash)\)
\(=>\mathrm{S}=22 \mathrm{~km} / \mathrm{hr}\).
```

Let the time taken by the train to cross an electric post be ' $t$ '. We can write the following:
$\backslash(=>\backslash \operatorname{frac}\{\mathrm{S}-2\}\{\mathrm{S}\}=\backslash \mathrm{frac}\{\mathrm{t}\}\{90\} \backslash)$
$\backslash(=>\backslash$ frac $\{20\}\{22\}=\backslash$ frac $\{t\}\{90\} \backslash)$
$=>\backslash(\mathrm{t} \backslash$ approx $82 \backslash)$ sec.
7. A gentleman decided to treat a few children in the following manner. He gives half of his total stock of toffees and one extra to the first child, and then the half of the remaining stock along with one extra to the second and continues giving away in this fashion. His total stock exhausts after he takes care of 5 children. How many toffees were there in his stock initially?

A 50

B 62

C 56

D 60

## Solution

We can solve this question by reverse calculations as stated in the table below:

| After child number | Number of <br> toffees |
| :--- | :--- |
| 5 | 0 |
| 4 | $2(0+1)=2$ |
| 3 | $2(2+1)=6$ |
| 2 | $2(6+1)=14$ |
| 1 | $2(14+1)=30$ |
| 0 | $2(30+1)=62$ |

8. If $a, b$, and $c$ are positive integers such that $\mathbf{a b}=432$, $b c=96$, and $c<$ 9 , then the smallest possible value of $\mathbf{a}+b+c$ is $\qquad$ .

A 46

B 59

C $\quad 49$

## D $\quad 56$

## Solution

It is given that,
$a b=432, b c=96$
Since $\mathrm{a}, \mathrm{b}$, c are positive integers and $\mathrm{c}<9$, we can get c as 8 or 6 or 4 or 3 or 2 or 1 .

We can calculate the possible values of $a, b$, and $c$ as shown:

| Case | $\mathbf{A}$ | $\mathbf{B}$ | $\mathbf{C}$ |
| :--- | :--- | :--- | :--- |
| 1 | 4.5 | 96 | 1 |
| 2 | 9 | 48 | 2 |
| 3 | 13.5 | 32 | 3 |

| Case | A | B | C |
| :--- | :--- | :--- | :--- |
| 4 | 18 | 24 | 4 |
| 5 | 27 | 16 | 6 |
| 6 | 36 | 12 | 8 |

Since all values should be integers, we can say that the cases 1 and 3 are to be ignored.

Hence,

| Case | A | B | C | $\mathrm{a}+\mathrm{b}+\mathrm{c}$ |
| :---: | :---: | :---: | :---: | :---: |
| 1 | 9 | 48 | 2 | 59 |
| 2 | 18 | 24 | 4 | 46 |
| 3 | 27 | 16 | 6 | 49 |
| 4 | 36 | 12 | 8 | 56 |

So, the minimum value of $(a+b+c)$ is 46 .
9. Among 100 students, $\mathbf{x} 1$ have birthdays in January, $\mathbf{x} 2$ have birthdays in February, and so on. If $\mathbf{x} 0=\max (x 1, x 2, \ldots, x 12)$, then the smallest possible value of $x 0$ is $\qquad$ .

A 10
(B) 9

C 12

D 8

## Solution

For the smallest possible value of x 0 , all ( $\mathrm{x} 1, \mathrm{x} 2, \mathrm{x} 3, \ldots, \mathrm{x} 12$ ) should be equal or closest to each other.
If we make all the values to be 8 , we will have 4 left. Those 4 can be distributed 1 each.

So, the maximum value will be 9 .
10. The mean of all 4-digit even natural numbers of the form 'aabb', where $a>0$, is $\qquad$ .
A 4466

B 4864

C 5050

## D $\mathbf{5 5 4 4}$

## Solution

The number 'aabb' means $1000 a+100 a+10 b+b=11(100 a+b)$.
Now, a can be $1,2,3 \ldots 9$ and $b$ can be $0,2,4,6,8$.
The numbers satisfying the given conditions are the following:
1100, 1122, 1144, 1166, 1188
2200, 2222, 2244, 2266, 2288

9900, 9922, 9944, 9966, 9988
We can notice that the numbers in each row are in AP.
So, the middle number of each row will be the mean of that row.
So, the mean of the rows are $1144,2244,3344,4444,5544,6644,7744$,

8844, and 9944.
Now the mean of these numbers is 5544.
Hence, the mean of all 4-digit even natural numbers of the form 'aabb' is 5544.
11. The number of real valued solutions of the equation $\backslash\left(2^{\wedge} x+2^{\wedge}\{-x\}=\right.$ $\left.2-(x-2)^{\wedge} 2 \backslash\right)$ is _.
A 1

B 0

C Infinite

## D 2

## Solution

Given,

$$
\backslash\left(2^{\wedge} \mathrm{x}+2^{\wedge}\{-\mathrm{x}\}=2-(\mathrm{x}-2)^{\wedge} 2 \backslash\right)
$$

$\backslash\left(2^{\wedge} \mathrm{x} \backslash\right)>0$ for all real values of x . We know that, for all positive values ' P ', $\backslash(\backslash$ square $+\backslash$ frac $\{1\}\{\backslash$ square $\} \backslash$ geq $2 \backslash)$ and the equality occurs at $\mathrm{P}=1$.
$\backslash\left(2^{\wedge} \mathrm{x}+2^{\wedge}\{-\mathrm{x}\} \backslash\right.$ geq $\left.2 \backslash\right)$

Now, since the square of any real quantity can be at least zero, we can write the following:
$\backslash\left((\text { square }-2)^{\wedge} 2 \backslash\right.$ geq $\left.0 \backslash\right)$
$=>\backslash\left(2-(x-2)^{\wedge} 2 \backslash \operatorname{leq} 2 \backslash\right)$

Now, the only possible solution is when both the LHS and RHS are equal to 2 simultaneously.
$\backslash\left(2^{\wedge} \mathrm{x}+2^{\wedge}\{-\mathrm{x}\}=2 \backslash\right.$ or $\left.\backslash \mathrm{x}=0 \backslash\right)$
And $\backslash\left(2-(x-2)^{\wedge} 2=2 \backslash\right.$ or $\left.\backslash x=2 \backslash\right)$
So, there is no common value of x for which LHS $=$ RHS.

Hence, the given equation does not have a solution.
12. How many distinct positive integer valued solutions exist to the equation? $\backslash\left(\left(x^{\wedge} 2-7 x+11\right)^{\wedge}\left\{\left(x^{\wedge} 2-13 x+42\right)\right\}=1 \backslash\right)$
A 8

B 2

C 4

## D 6

## Solution

$$
\backslash\left(\left(x^{\wedge} 2-7 x+11\right)^{\wedge}\left\{\left(x^{\wedge} 2-13 x+42\right)\right\}=1 \backslash\right)
$$

in the following cases:

| Case | $\left.\backslash\left(\mathbf{x}^{\wedge} \mathbf{2 - 7} \mathbf{x}+\mathbf{1 1}\right) \backslash\right)$ | $\left.\backslash\left(\mathbf{x}^{\wedge} \mathbf{2 - 1 3} \mathbf{x}+\mathbf{4 2}\right) \backslash\right)$ | Value/s of $\mathbf{x}$ |
| :--- | :--- | :--- | :--- |
| 1 | 1 | Immaterial | 5 or 2 |
| 2 | Non zero | 0 | 6 or 7 |
| 3 | $(-1)$ | Even | 3 or 4 |

So, there are SIX possible values of x .
13. In a group of people, $\mathbf{2 8 \%}$ of the members are young, while the rest are old. If $\mathbf{6 5 \%}$ of the members are literates, and $\mathbf{2 5 \%}$ of the literates are young, then the percentage of old people among the illiterates is nearest to $\qquad$ .
A
66

B 59

C 62

D 55

## Solution

From the given data:

|  | Young | Old | Total |
| :--- | :--- | :--- | :--- |
| Literates | 16.25 | 48.75 | 65 |
| Illiterates | 11.75 | 23.25 | 35 |
| Total | 28 | 72 | 100 |

We have filled in the values from the given data.
So, the required percentage $=\backslash(\backslash$ frac $\{23.25\}\{35\} \times 100 \backslash \%=66 \backslash \% \backslash)($ approx.)
14. A straight road connects points $A$ and $B$. Car 1 travels from $A$ to $B$ and Car 2 travels from B to A, both leaving at the same time. After meeting each other, they take 45 minutes and 20 minutes, respectively, to complete their journey. If Car 1 travels at the speed of $60 \mathrm{~km} / \mathrm{h}$, then the speed of Car 2 , in $\mathrm{km} / \mathrm{hr}$, is $\qquad$ .

## A $\quad 100$

B 80
C
90

D 70

## Solution

Let the two cars meet at point $M$ and the time they take to meet is ' $t$ ' min. Also, assume the speed of Car 1 to be S1 and that of Car 2 to be S2. [in suitable units]
Time taken by Car 1 to travel from $A$ to $M=t \mathrm{~min}$
Time taken by Car 2 to travel from M to $\mathrm{A}=20 \mathrm{~min}$
Since distance is same in both cases, we can write the following:
$\backslash\left(\backslash \operatorname{frac}\left\{\mathrm{S} \_1\right\}\left\{\mathrm{S} \_2\right\}=\backslash \mathrm{frac}\{20\}\{t\} \backslash\right)$
Similarly, we can write the following:
Time taken by Car 1 to travel from M to $\mathrm{B}=45 \mathrm{~min}$
Time taken by Car 2 to travel from $B$ to $M=t \mathrm{~min}$
Since distance is same in both the cases, we can write the following:
$\backslash\left(\mid \operatorname{frac}\left\{\mathrm{S} \_1\right\}\left\{\mathrm{S} \_2\right\}=\backslash \mathrm{frac}\{\mathrm{t}\}\{45\} \backslash\right)$
From (1) and (2), we get the following:
$\backslash(\mid \operatorname{frac}\{20\}\{\mathrm{t}\}=\backslash \operatorname{frac}\{\mathrm{t}\}\{45\} \backslash)$
$\Rightarrow \mathrm{t}=30 \mathrm{~min}$.

Putting $\mathrm{t}=30$ and $\mathrm{S} 1=60$ in the first equation, we get the following:
$\backslash\left(\backslash \operatorname{frac}\{60\}\left\{\mathrm{S} \_2\right\}=\backslash \mathrm{frac}\{20\}\{30\} \backslash\right)$
$=>\backslash\left(\mathrm{S} \_2=90 \backslash\right) \mathrm{km} / \mathrm{hr}$
15. A person spent Rs. 50000 to purchase a desktop computer and a laptop computer. He sold the desktop at $\mathbf{2 0 \%}$ profit and the laptop at $\mathbf{1 0 \%}$ loss. If he made a $\mathbf{2 \%}$ profit overall, then the purchase price, in rupees, of the desktop is $\qquad$ .

A 10000

B 20000

C 15000

D 25000

## Solution

Using allegations, we can find the ratio of the cost prices of the two articles.

Desktop:Laptop $=2: 3$
Cost price of desktop $=\backslash(\backslash$ frac $\{2\}\{2+3\} \backslash$ times $50000=$ Rs. $20000 \backslash)$
16. If $f(5+x)=f(5-x)$ for every real $x$, and $f(x)=0$ has four distinct real roots, then the sum of these roots is $\qquad$ .
A
20

B 0

C $\quad 40$

## D $\quad 10$

## Solution

Given,
$\mathrm{f}(5+\mathrm{x})=\mathrm{f}(5-\mathrm{x})$
Let $\mathrm{x}=5-\mathrm{y}$
Putting this value, we get the following:
$f(10-y)=f(y)$
Now let $a$ and $b$ be two of the four roots of $f(X)=0$.
$\Rightarrow \mathrm{f}(\mathrm{a})=\mathrm{f}(\mathrm{b})=0$
Substituting $\mathrm{y}=\mathrm{a}$ in equation (1), we get the following:
$\mathrm{f}(10-\mathrm{a})=\mathrm{f}(\mathrm{a})=0$
This means $10-\mathrm{a}$ is the root of the given equation.
Similarly, if b is a root, then $(10-\mathrm{b})$ is also a root of the given equation.
Hence, the four roots of the given equation are $\mathrm{a}, \mathrm{b}, 10-\mathrm{a}$, and $10-\mathrm{b}$.
17. Veeru invested Rs. 10000 at $5 \%$ simple annual interest, and exactly after two years, Joy invested Rs. 8000 at $10 \%$ simple annual interest. How many years after Veeru's investment will their balances, i.e., principal plus accumulated interest, be equal?
A
10

B $\quad 14$

C $\quad 16$

D 12

## Solution

We can draw the following table:

| Name | Principal | Rate | Year | Interest | Amount |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Veeru | 10000 | 5 | $T$ | 500 T | $10000+500 \mathrm{~T}$ |
| Joy | 8000 | 10 | $\mathrm{~T}-2$ | $800(\mathrm{~T}-2)$ | $8000+800(\mathrm{~T}-2)$ |

So, $10000+500 \mathrm{~T}=8000+800(\mathrm{~T}-2)$
$2000+500 \mathrm{~T}=800 \mathrm{~T}-1600$
$\Rightarrow 3600=300 \mathrm{~T}$
$\Rightarrow \mathrm{T}=12$
18. On a rectangular metal sheet of area $\mathbf{1 3 5} \mathbf{~ s q ~ i n , ~ a ~ c i r c l e ~ i s ~ p a i n t e d ~ s u c h ~}$ that the circle touches two possible sides. If the area of the sheet left unpainted is twothirds of the painted area, then the perimeter of the rectangle, in inches, is _.
A $\backslash(5 \backslash \operatorname{sqrt}\{\backslash \operatorname{pi}\}(3+\backslash \operatorname{frac}\{9\}\{\backslash \mathrm{pi}\}) \backslash)$

B $\quad \backslash(3 \backslash \operatorname{sqrt}\{\backslash \operatorname{pi}\}(\backslash \operatorname{frac}\{5\}\{2\}+\backslash \operatorname{frac}\{6\}\{\backslash \operatorname{pi}\}) \backslash)$

C $\quad \backslash(4 \backslash$ sqrt $\{\backslash \operatorname{pi}\}(3+\backslash \operatorname{frac}\{9\}\{\backslash \mathrm{pi}\}) \backslash)$

## D $\quad \backslash(3 \backslash$ sqrt $\{\backslash$ pi $\}(5+\backslash$ frac $\{12\}\{\backslash p i\}) \backslash)$

## Solution

Let the dimensions of the rectangle be x and y , where $\mathrm{x}<\mathrm{y}$.
Then, $\mathrm{xy}=135$
Diameter of the circle $=x$
$\Rightarrow$ Radius of circle $=\backslash(\backslash \operatorname{frac}\{\mathrm{x}\}\{2\} \backslash)$
Painted area of sheet $=\backslash\left(\backslash \mathrm{pi}(\backslash \operatorname{frac}\{\mathrm{x}\}\{2\})^{\wedge} 2 \backslash\right)$

Troestitinmaterording to the question, we can write the following:
$\backslash\left(135-\backslash\right.$ pi $(\backslash \operatorname{frac}\{x\}\{2\})^{\wedge} 2=\backslash \operatorname{frac}\{2\}\{3\} \backslash \backslash$ times $\left.\left.\backslash \operatorname{pi}(\backslash \operatorname{frac}\{x\}\{2\})^{\wedge} 2\right) \backslash\right)$
$=>\backslash\left(135=\backslash \operatorname{frac}\{5\}\{3\} \backslash \backslash\right.$ times $\left.\backslash \operatorname{pi}(\backslash \operatorname{frac}\{x\}\{2\})^{\wedge} 2 \backslash\right)$
$=>\backslash\left(\backslash \operatorname{frac}\{81\}\{\backslash \mathrm{pi}\}=(\backslash \operatorname{frac}\{\mathrm{x}\}\{2\})^{\wedge} 2 \backslash\right)$
$\Rightarrow \backslash(x=\backslash \operatorname{frac}\{18\}\{\backslash \mathrm{sqrt}\{\backslash \mathrm{pi}\}\} \backslash)$ inches.
Putting this in (1), we get the following:
$\backslash(\mathrm{y}=\backslash \operatorname{frac}\{135 \backslash \mathrm{sqrt}\{\backslash \mathrm{pi}\}\}\{18\}=\backslash \operatorname{frac}\{15 \backslash \mathrm{sqrt}\{\backslash \mathrm{pi}\}\}\{2\} \backslash)$ inches.
Perimeter of rectangle $=2 \mathrm{x}+2 \mathrm{y}=\backslash(\mid \operatorname{frac}\{36\}\{\backslash$ sqrt $\{\backslash \mathrm{pi}\}\}+15 \backslash$ sqrt $\{\backslash \mathrm{pi}\}$ $=3 \backslash$ sqrt $\{\backslash \mathrm{pi}\}(5+\backslash \mathrm{frac}\{12\}\{\backslash \mathrm{pi}\}) \backslash)$
19. How many 3-digit numbers are there, for which the product of their digits is more than 2 but less than 7 ?
A 21

B 19

C $\quad 17$

D 15

## Solution

Let us assume the three digit number is abc.
Since $2<\mathrm{a} \times \mathrm{b} \times \mathrm{c}<7$, the product of the digits can be $3,4,5$, or 6 .

| Case | Product | A | B | C | No. of numbers |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 1 | 3 | 1 | 1 | 3 | $3!/ 2!=3$ |
| 2 | 4 | 1 | 1 | 4 | 3 |
| 3 | 4 | 1 | 2 | 2 | 3 |
| 4 | 5 | 1 | 1 | 5 | 3 |
| 5 | 6 | 1 | 2 | 3 | $3!=6$ |
| 6 | 6 | 1 | 1 | 6 | 3 |
| Total |  |  |  |  | 21 |

20. The number of distinct real roots of the equation $\backslash($ ( $\mid$ square $+\backslash f r a c\{1\}$

A 0

B 1

C $\quad 10$

## D 2

## Solution

Substituting $\backslash((x+\backslash f r a c\{1\}\{x\}))$ in the given equation, we get the following:
$\backslash\left(y^{\wedge} 2-3 y+2=0 \backslash\right)$
$=>(y 1)(y 2)=0$
$\Rightarrow \mathrm{y}=1$ or 2
Case 1: If $y=1$
$\backslash(\mathrm{x}+\backslash \mathrm{frac}\{1\}\{\mathrm{x}\}=1 \backslash)$
$\backslash\left(x^{\wedge} 2-x+1=0 \backslash\right)$
$\mathrm{D}=\backslash\left((-1)^{\wedge} 2-4 \backslash\right.$ times $1 \backslash$ times $\left.1=-3<0 \backslash\right)$
There is no real root in this case.

Case 2: If $\mathrm{y}=2$
$\backslash(x+\backslash f r a c\{1\}\{x\}=2 \backslash)$
$\backslash\left(x^{\wedge} 2-2 x+1=0 \backslash\right)$
$\mathrm{D}=\backslash\left((-2)^{\wedge} 2-4 \backslash\right.$ times $1 \backslash$ times $\left.1=0 \backslash\right)$
There is exactly one distinct real root in this case.
Hence, the given equation has only 1 distinct real root
21. A solution of volume 40 litres has dye and water in the proportion $\mathbf{2 : 3}$. Water is added to the solution to change this proportion to $\mathbf{2 : 5}$. If one-fourths of this diluted solution is taken out, how many litres of dye must be added to the remaining solution to bring the proportion back to 2:3?

A $\quad 4$

## B 6

## C 8

## D 10

## Solution

For the initial solution,
Total volume $=40$ litres
Volume of dye $=\backslash(\backslash \operatorname{frac}\{2\}\{5\} \backslash$ of $\backslash 40=16 \backslash$ litres $\backslash)$ Volume of water $=\backslash($ $\backslash$ frac $\{3\}\{5\} \backslash$ of $\backslash 40=\backslash 24 \backslash$ litres $\backslash$ )

Now we add water to change the proportion to $2: 5$.
So, the volume of dye will not change.
Volume of dye in the new solution $=16$ litres
Since water:dye $=5: 2$
$\Rightarrow$ Volume of water in new solution $=\backslash(\backslash \operatorname{frac}\{5\}\{2\} \backslash$ of $\backslash 16=40 \backslash$ litres $\backslash)$
Total volume of new solution $=56$ litres

Now $\backslash(\backslash$ frac $\{1\}\{4\} \backslash)$ th of the solution is removed.
So, $\backslash(\mid \operatorname{frac}\{3\}\{4\} \backslash)$ th of the solution remains.
Total volume left $=\backslash((\operatorname{frac}\{3\}\{4\} \backslash)$ of $56=42$ litres
Volume of dye left $=\backslash(\backslash \operatorname{frac}\{3\}\{4\} \backslash)$ of $16=12$ litres
Volume of water left $=\backslash(\backslash \operatorname{frac}\{3\}\{4\} \backslash)$ of $40=30$ litres
Volume of dye $=\backslash(\backslash$ frac $\{2\}\{3\} \backslash)$ of $30=20$ litres
Volume of dye added $=20-12=8$ litres
22. The area of the region satisfying the inequalities $|x|-y \leq 1, y \geq 0$ and $y \leq 1$ is
A
3

B 5

C 1

## D 2

## Solution

We can draw the following graph by using the given inequalities.

The required region is the area of the trapezium ABCD shown in the graph.
$\mathrm{AB}=2$ units
$C D=4$ units
$\mathrm{h}=1$ unit
Area of a trapezium is $1 / 2 \times$ height $\times$ sum of the parallel sides
Area $=\backslash(\backslash \operatorname{frac}\{1\}\{2\}(2+4) \backslash$ times $1=3 \backslash)$ sq. unit
23. A circle is inscribed in a rhombus with diagonals 12 cm and 16 cm . The ratio of the area of the circle to the area of the rhombus is ..

A $\backslash(\mid \operatorname{frac}\{6 \backslash \mathrm{pi}\}\{25\} \backslash)$

B $\backslash(\backslash \operatorname{frac}\{2 \backslash \mathrm{pi}\}\{15\} \backslash)$

C $\backslash(\backslash \operatorname{frac}\{3 \backslash \mathrm{pi}\}\{25\} \backslash)$

D $\backslash(\backslash \operatorname{frac}\{5 \backslash \mathrm{pi}\}\{18\} \backslash)$

## Solution

We know that diagonals of the rhombus bisect each other at 900 .

Therefore, using Pythagoras' theorem, we can write the following:
Side of rhombus $=\backslash\left(\backslash \operatorname{sqrt}\left\{(\backslash \operatorname{frac}\{12\}\{2\})^{\wedge} 2+(\backslash \operatorname{frac}\{16\}\{2\})^{\wedge} 2\right\}=10 \backslash \mathrm{~cm} \backslash\right)$
Area of rhombus $=\backslash\left(\backslash \operatorname{frac}\{1\}\{2\} \backslash\right.$ times $12 \backslash$ times $\left.16=96 \backslash \mathrm{~cm}^{\wedge} 2 \backslash\right)$

Also, area of rhombus $=\mathrm{sxr}$, where ' s ' is the semi-perimeter and ' $r$ ' is the radius of the incircle.
$96=20 \mathrm{x} \mathrm{r}$
$\mathrm{r}=\backslash(\backslash \operatorname{frac}\{24\}\{5\} \backslash \mathrm{cm} \backslash)$
$\backslash(\backslash$ frac $\{$ Area $\backslash$ of $\backslash$ circle $\}\{$ Area $\backslash$ of $\backslash$ rhombus $\}=\backslash$ frac $\{\backslash \operatorname{pi}(\backslash$ frac $\{24\}$
$\left.\{5\})^{\wedge} 2\right\}\{96\}=\backslash$ frac $\left.\{6 \backslash \mathrm{pi}\}\{25\} \backslash\right)$
24. If $y$ is a negative number such that $\backslash\left(2^{\wedge}\left\{y^{\wedge} 2 \backslash \backslash \log \_35\right\}=5 \backslash \backslash \log \_23 \backslash\right)$, then y equals .

A $\backslash(-\backslash \log 2(\operatorname{frac}\{1\}\{5\}))$

B $\backslash\left(\log \_2(\mid f r a c\{1\}\{3\})\right)$

C $\quad \backslash\left(\log \_2(\mid \operatorname{frac}\{1\}\{5\})\right)$

D $\backslash\left(-\backslash \log _{-} 2((\operatorname{frac}\{1\}\{3\}))\right.$

## Solution

$\backslash\left(2^{\wedge}\left\{y^{\wedge} 2 \backslash \backslash \log \_35\right\}=5 \backslash \backslash \log \_23 \backslash\right)$
Taking log both sides, we get the following:
$\backslash\left(\backslash \log 2^{\wedge}\left\{y^{\wedge} 2 \backslash \backslash \log 35\right\}=\backslash \log 5 \backslash \backslash \log \_23 \backslash\right)$
$=>\backslash\left(y^{\wedge} 2 \backslash \backslash \log \_35 \backslash\right.$ times $\backslash \log 2=\backslash \log 5 \backslash$ times $\left.\backslash \log \_23 \backslash\right)$
$=>\backslash\left(y^{\wedge} 2 \backslash\right.$ times $\backslash f r a c\{\backslash \log 5\}\{\backslash \log 3\} \backslash$ times $\backslash \log 2=\backslash$ frac $\{\backslash \log 3\}\{\backslash \log 2\}$ $\backslash$ times $\backslash \log 5 \backslash$ )

Cancelling $\log 5$ from both sides, we get the following:
$=>\backslash\left(y^{\wedge} 2=(\backslash \log 23)^{\wedge} 2 \backslash\right)$
$=>\backslash\left(\mathrm{y}=\backslash \mathrm{pm} \backslash \log \_23 \backslash\right)$

Since it is given that ' $y$ ' is negative, option (B) is the correct answer.
25. A train travelled at one-thirds of its usual speed, and hence reached the destination 30 minutes after the scheduled time. On its return journey, the train initially travelled at its usual speed for 5 minutes but then stopped for 4 minutes for an emergency. The percentage by which the train must now increase its usual speed so as to reach the destination at the scheduled time, is nearest to _.
A
67

B 61

C 50

D 58

## Solution

Let the scheduled time be T.
If the speed is $\backslash(\backslash \operatorname{frac}\{1\}\{3\} \backslash)$ of the usual speed, then the time should be 3 times the initial time taken.

So, new time $=3 \mathrm{~T}$
$3 \mathrm{~T}-\mathrm{T}=30$
$\Rightarrow \mathrm{T}=15 \mathrm{~min}$
On the return journey, the train travelled at its usual speed for 5 min .
So, the remaining distance should be covered in 10 min at the usual speed.
Since 4 min are wasted, the distance should be covered in 6 min .

The remaining time is $\backslash(\backslash \operatorname{frac}\{6\}\{10\}=\backslash$ frac $\{3\}\{5\} \backslash)$ of the usual time.
So, the speed should be $\backslash(\mid \operatorname{frac}\{5\}\{3\}=166.67 \backslash \% \backslash)$ of the usual speed.
So, the speed should increase by $67 \%$ approx.
26. If $\backslash\left(x=(4096)^{\wedge}\{7+4 \backslash \operatorname{sqrt}\{3\}\} \backslash\right)$, then which of the following equals 64 ?

A $\backslash\left(\operatorname{frac}\left\{\mathrm{x}^{\wedge} 7\right\}\left\{\mathrm{x}^{\wedge}\{2 \backslash \operatorname{sqrt}\{3\}\}\right\} \backslash\right)$

B $\backslash\left(\operatorname{frac}\left\{\mathrm{x}^{\wedge} 7\right\}\left\{\mathrm{x}^{\wedge}\{4 \backslash \operatorname{sqrt}\{3\}\}\right\} \backslash\right)$

C $\backslash\left(\mid \operatorname{frac}\left\{x^{\wedge}\{\mid \operatorname{frac}\{7\}\{2\}\}\right\}\left\{x^{\wedge}\{2 \backslash \operatorname{sqrt}\{\mathbf{3}\}\}\right\}\right)$

D $\backslash\left(\operatorname{frac}\left\{\mathrm{x}^{\wedge}\{\backslash \operatorname{frac}\{7\}\{2\}\}\right\}\left\{\mathrm{x}^{\wedge}\{2 \backslash \mathrm{sqrt}\{3\}\}\right\} \backslash\right)$

## Solution

$\backslash\left(\mathrm{x}=(4096)^{\wedge}\{7+4 \backslash \mathrm{sqrt}\{3\}\} \backslash\right)$

Taking both sides power, we get the following:
$=>\backslash\left(\mathrm{x}^{\wedge}\{7-4 \backslash \operatorname{sqrt}\{3\}\}=(4096)^{\wedge}\{(7+4 \backslash \mathrm{sqrt}\{3\})(7-4 \backslash \mathrm{sqrt}\{3\})\} \backslash\right)$
Simplifying this, we can write the following:
$=>\backslash\left(x^{\wedge}\{7-4 \backslash\right.$ sqrt $\left.\{3\}\}=\left(64^{\wedge} 2\right)^{\wedge} 1 \backslash\right)$
$=>\backslash\left(64=\left(x^{\wedge}\{7-4 \backslash \operatorname{sqrt}\{3\}\}\right)^{\wedge}\{\backslash \operatorname{frac}\{1\}\{2\}\} \backslash\right)$
$\Rightarrow>\backslash\left(64=\left(x^{\wedge}\{\backslash \operatorname{frac}\{7\}\{2\}-2 \backslash\right.\right.$ sqrt $\left.\left.\{3\}\}\right) \backslash\right)$
$=>\backslash\left(64=\backslash\right.$ frac $\left\{x^{\wedge}\{\backslash\right.$ frac $\left.\left.\{7\}\{2\}\}\right\}\{2 \backslash \operatorname{sqrt}\{3\}\} \backslash\right)$
Hence, option (C) is the correct answer.
