

SQL CHEAT SHEET

COMPREHENSIVE

Data Control Language (DCL) Commands

Command	Description	Syntax	Example
GRANT	The GRANT command is used to give specific privileges to users or roles.	GRANT SELECT, INSERT ON table_name TO user_name;	GRANT SELECT, INSERT ON employees TO 'John Doe';
REVOKE	The REVOKE command is used to take away privileges previously granted to users or roles.	REVOKE SELECT, INSERT ON table_name FROM user_name;	REVOKE SELECT, INSERT ON employees FROM 'John Doe';

Querying Data Commands

Command	Description	Syntax	Example
SELECT Statement	The SELECT statement is the primary command used to retrieve data from a database	SELECT column1, column2 FROM table_name;	SELECT first_name, last_name FROM customers;
WHERE Clause	The WHERE clause is used to filter rows based on a specified condition.	SELECT * FROM table_name WHERE condition;	SELECT * FROM customers WHERE age > 30;
ORDER BY Clause	The ORDER BY clause is used to sort the result set in ascending or descending order based on a specified column.	SELECT * FROM table_name ORDER BY column_name ASC DESC;	SELECT * FROM products ORDER BY price DESC;
GROUP BY Clause	The GROUP BY clause groups rows based on the values in a specified column. It is often used with aggregate functions like COUNT, SUM, AVG, etc.	SELECT column_name, COUNT(*) FROM table_name GROUP BY column_name;	SELECT category, COUNT(*) FROM products GROUP BY category;
HAVING Clause	The HAVING clause filters grouped results based on a specified condition.	SELECT column_name, COUNT(*) FROM table_name GROUP BY column_name HAVING condition;	SELECT category, COUNT(*) FROM products GROUP BY category HAVING COUNT(*) > 5;

Joining Commands

Command	Description	Syntax	Example
INNER JOIN	The INNER JOIN command returns rows with matching values in both tables.	SELECT * FROM table1 INNER JOIN table2 ON table1.column = table2.column;	SELECT * FROM employees INNER JOIN departments ON employees.department_id = departments.id;
LEFT JOIN/LEFT OUTER JOIN	The LEFT JOIN command returns all rows from the left table (first table) and the matching rows from the right table (second table).	SELECT * FROM table1 LEFT JOIN table2 ON table1.column = table2.column;	SELECT * FROM employees LEFT JOIN departments ON employees.department_id = departments.id;
RIGHT JOIN/RIGHT OUTER JOIN	The RIGHT JOIN command returns all rows from the right table (second table) and the matching rows from the left table (first table).	SELECT * FROM table1 RIGHT JOIN table2 ON table1.column = table2.column;	SELECT * FROM employees RIGHT JOIN departments ON employees.department_id = departments.department_id;
FULL JOIN/FULL OUTER JOIN	The FULL JOIN command returns all rows when there is a match in either the left table or the right table.	SELECT * FROM table1 FULL JOIN table2 ON table1.column = table2.column;	SELECT * FROM employees LEFT JOIN departments ON employees.employee_id = departments.employee_id UNION SELECT * FROM employees RIGHT JOIN departments ON employees.employee_id = departments.employee_id;
CROSS JOIN	The CROSS JOIN command combines every row from the first table with every row from the second table, creating a Cartesian product.	SELECT * FROM table1 CROSS JOIN table2;	SELECT * FROM employees CROSS JOIN departments;
SELF JOIN	The SELF JOIN command joins a table with itself.	SELECT * FROM table1 t1, table1 t2 WHERE t1.column = t2.column;	SELECT * FROM employees t1, employees t2 WHERE t1.employee_id = t2.employee_id;
NATURAL JOIN	The NATURAL JOIN command matches columns with the same name in both tables.	SELECT * FROM table1 NATURAL JOIN table2;	SELECT * FROM employees NATURAL JOIN departments;

Subqueries in SQL

Command	Description	Syntax	Example
IN	The IN command is used to determine whether a value matches any value in a subquery result. It is often used in the WHERE clause.	SELECT column(s) FROM table WHERE value IN (subquery);	SELECT * FROM customers WHERE city IN (SELECT city FROM suppliers);
ANY	The ANY command is used to compare a value to any value returned by a subquery. It can be used with comparison operators like =, >, <, etc.	SELECT column(s) FROM table WHERE value < ANY (subquery);	SELECT * FROM products WHERE price < ANY (SELECT unit_price FROM supplier_products);
ALL	The ALL command is used to compare a value to all values returned by a subquery. It can be used with comparison operators like =, >, <, etc.	SELECT column(s) FROM table WHERE value > ALL (subquery);	SELECT * FROM orders WHERE order_amount > ALL (SELECT total_amount FROM previous_orders);

Aggregate Functions Commands

Command	Description	Syntax	Example
COUNT()	The COUNT command counts the number of rows or non-null values in a specified column.	SELECT COUNT(column_name) FROM table_name;	SELECT COUNT(age) FROM employees;
SUM()	The SUM command is used to calculate the sum of all values in a specified column.	SELECT SUM(column_name) FROM table_name;	SELECT SUM(revenue) FROM sales;
AVG()	The AVG command is used to calculate the average (mean) of all values in a specified column.	SELECT AVG(column_name) FROM table_name;	SELECT AVG(price) FROM products;
MIN()	The MIN command returns the minimum (lowest) value in a specified column.	SELECT MIN(column_name) FROM table_name;	SELECT MIN(price) FROM products;
MAX()	The MAX command returns the maximum (highest) value in a specified column.	SELECT MAX(column_name) FROM table_name;	SELECT MAX(price) FROM products;

String Functions in SQL

Command	Description	Syntax	Example
CONCAT()	The CONCAT command concatenates two or more strings into a single string.	SELECT CONCAT(string1, string2, ...) AS concatenated_string FROM table_name;	SELECT CONCAT(first_name, ' ', last_name) AS full_name FROM employees;
SUBSTRING()/SUBSTR()	The SUBSTRING command extracts a substring from a string.	SELECT SUBSTRING(string FROM start_position [FOR length]) AS substring FROM table_name;	SELECT SUBSTRING(product_name FROM 1 FOR 5) AS substring FROM products;
CHAR_LENGTH()/LENGTH()	The LENGTH command returns the length (number of characters) of a string.	SELECT CHAR_LENGTH(string) AS length FROM table_name;	SELECT CHAR_LENGTH(product_name) AS length FROM products;
UPPER()	The UPPER command converts all characters in a string to uppercase.	SELECT UPPER(string) AS uppercase_string FROM table_name;	SELECT UPPER(first_name) AS uppercase_first_name FROM employees;
LOWER()	The LOWER command converts all characters in a string to lowercase.	SELECT LOWER(string) AS lowercase_string FROM table_name;	SELECT LOWER(last_name) AS lowercase_last_name FROM employees;
TRIM()	The TRIM command removes specified prefixes or suffixes (or whitespace by default) from a string.	SELECT TRIM([LEADING TRAILING BOTH] characters FROM string) AS trimmed_string FROM table_name;	SELECT TRIM(TRAILING ' ' FROM full_name) AS trimmed_full_name FROM customers;
LEFT()	The LEFT command returns a specified number of characters from the left of a string.	SELECT LEFT(string, num_characters) AS left_string FROM table_name;	SELECT LEFT(product_name, 5) AS left_product_name FROM products;
RIGHT()	The RIGHT command returns a specified number of characters from the right of a string.	SELECT RIGHT(string, num_characters) AS right_string FROM table_name;	SELECT RIGHT(order_number, 4) AS right_order_number FROM orders;
REPLACE()	The REPLACE command replaces occurrences of a substring within a string.	SELECT REPLACE(string, old_substring, new_substring) AS replaced_string FROM table_name;	SELECT REPLACE(description, 'old_string', 'new_string') AS replaced_description FROM product_descriptions;

Date and Time SQL Commands

Command	Description	Syntax	Example
CURRENT_DATE()	The CURRENT_DATE command returns the current date.	SELECT CURRENT_DATE() AS current_date;	←
CURRENT_TIME()	The CURRENT_TIME command returns the current time.	SELECT CURRENT_TIME() AS current_time;	←
CURRENT_TIMESTAMP()	The CURRENT_TIMESTAMP command returns the current date and time.	SELECT CURRENT_TIMESTAMP() AS current_timestamp;	←
DATE_PART()	The DATE_PART command extracts a specific part (e.g., year, month, day) from a date or time.	SELECT DATE_PART('part', date_expression) AS extracted_part;	SELECT DATE_PART('year', '2024-04-11') AS extracted_part;
DATE_ADD()/DATE_SUB()	The DATE_ADD command adds or subtracts a specified number of days, months, or years to/from a date.	SELECT DATE_ADD(date_expression, INTERVAL value unit) AS new_date;	<p>-- DATE_ADD Example</p> <pre>SELECT DATE_ADD('2024-04-11', INTERVAL 1 DAY) AS new_date;</pre> <p>-- DATE_SUB Example</p> <pre>SELECT DATE_SUB('2024-04-11', INTERVAL 1 DAY) AS new_date;</pre>
EXTRACT()	The EXTRACT command extracts a specific part (e.g., year, month, day) from a date or time.	SELECT EXTRACT(part FROM date_expression) AS extracted_part;	SELECT EXTRACT(YEAR FROM '2024-04-11') AS extracted_part;
TO_CHAR()	The TO_CHAR command converts a date or time to a specified format.	SELECT TO_CHAR(date_expression, 'format') AS formatted_date;	SELECT TO_CHAR('2024-04-11', 'YYYY-MM-DD') AS formatted_date;
TIMESTAMPDIFF()	The TIMESTAMPDIFF command calculates the difference between two timestamps in a specified unit (e.g., days, hours, minutes).	SELECT TIMESTAMPDIFF(unit, timestamp1, timestamp2) AS difference;	SELECT TIMESTAMPDIFF(DAY, '2024-04-10', '2024-04-11') AS difference;
DATEDIFF()	The DATEDIFF command calculates the difference in days between two dates.	SELECT DATEDIFF(date1, date2) AS difference_in_days;	SELECT DATEDIFF('2024-04-11', '2024-04-10') AS difference_in_days;

Conditional Expressions

Command	Description	Syntax	Example
CASE Statement	The CASE statement allows you to perform conditional logic within a query.	<pre>SELECT column1, column2, CASE WHEN condition1 THEN result1 WHEN condition2 THEN result2 ELSE default_result END AS alias FROM table_name;</pre>	<pre>SELECT order_id, total_amount, CASE WHEN total_amount > 1000 THEN 'High Value Order' WHEN total_amount > 500 THEN 'Medium Value Order' ELSE 'Low Value Order' END AS order_status FROM orders;</pre>
IF() Function	The IF() function evaluates a condition and returns a value based on the evaluation.	<pre>SELECT IF(condition, true_value, false_value) AS alias FROM table_name;</pre>	<pre>SELECT name, age, IF(age > 50, 'Senior', 'Junior') AS employee_category FROM employees;</pre>
COALESCE() Function	The COALESCE() function returns the first non-null value from a list of values.	<pre>SELECT COALESCE(value1, value2, ...) AS alias FROM table_name;</pre>	<pre>SELECT COALESCE(first_name, middle_name) AS preferred_name FROM employees;</pre>
NULLIF() Function	The NULLIF() function returns null if two specified expressions are equal.	<pre>SELECT NULLIF(expression1, expression2) AS alias FROM table_name;</pre>	<pre>SELECT NULLIF(total_amount, discounted_amount) AS diff_amount FROM orders;</pre>

Set Operations

Command	Description	Syntax	Example
UNION	The UNION operator combines the result sets of two or more SELECT statements into a single result set.	<pre>SELECT column1, column2 FROM table1 UNION SELECT column1, column2 FROM table2;</pre>	<pre>SELECT first_name, last_name FROM customers UNION SELECT first_name, last_name FROM employees;</pre>
INTERSECT	The INTERSECT operator returns the common rows that appear in both result sets.	<pre>SELECT column1, column2 FROM table1 INTERSECT SELECT column1, column2 FROM table2;</pre>	<pre>SELECT first_name, last_name FROM customers INTERSECT SELECT first_name, last_name FROM employees;</pre>
EXCEPT	The EXCEPT operator returns the distinct rows from the left result set that are not present in the right result set.	<pre>SELECT column1, column2 FROM table1 EXCEPT SELECT column1, column2 FROM table2;</pre>	<pre>SELECT first_name, last_name FROM customers EXCEPT SELECT first_name, last_name FROM employees;</pre>

Transaction Control Commands

Command	Description	Syntax	Example
COMMIT	The COMMIT command is used to save all the changes made during the current transaction and make them permanent.	COMMIT;	<pre>BEGIN TRANSACTION; -- SQL statements and changes within the transaction INSERT INTO employees (name, age) VALUES ('Alice', 30); UPDATE products SET price = 25.00 WHERE category = 'Electronics'; COMMIT;</pre>
ROLLBACK	The ROLLBACK command is used to undo all the changes made during the current transaction and discard them.	ROLLBACK;	<pre>BEGIN TRANSACTION; -- SQL statements and changes within the transaction INSERT INTO employees (name, age) VALUES ('Bob', 35); UPDATE products SET price = 30.00 WHERE category = 'Electronics'; ROLLBACK;</pre>

<p>SAVEPOINT</p>	<p>The SAVEPOINT command is used to set a point within a transaction to which you can later roll back.</p>	<pre>SAVEPOINT savepoint_name;</pre>	<pre>BEGIN TRANSACTION; INSERT INTO employees (name, age) VALUES ('Carol', 28); SAVEPOINT before_update; UPDATE products SET price = 40.00 WHERE category = 'Electronics'; SAVEPOINT after_update; DELETE FROM customers WHERE age > 60; ROLLBACK TO before_update; -- At this point, the DELETE is rolled back, but the UPDATE remains. COMMIT;</pre>
<p>ROLLBACK TO SAVEPOINT</p>	<p>The ROLLBACK TO SAVEPOINT command is used to roll back to a specific savepoint within a transaction.</p>	<pre>ROLLBACK TO SAVEPOINT savepoint_name;</pre>	<pre>BEGIN TRANSACTION; INSERT INTO employees (name, age) VALUES ('David', 42); SAVEPOINT before_update; UPDATE products SET price = 50.00 WHERE category = 'Electronics'; SAVEPOINT after_update; DELETE FROM customers WHERE age > 60; -- Rollback to the savepoint before the update ROLLBACK TO SAVEPOINT before_update; -- At this point, the UPDATE is rolled back, but the INSERT remains. COMMIT;</pre>
<p>SET TRANSACTION</p>	<p>The SET TRANSACTION command is used to configure properties for the current transaction, such as isolation level and transaction mode.</p>	<pre>SET TRANSACTION [ISOLATION LEVEL { READ COMMITTED SERIALIZABLE }]</pre>	<pre>BEGIN TRANSACTION; -- Set the isolation level to READ COMMITTED SET TRANSACTION ISOLATION LEVEL READ COMMITTED; -- SQL statements and changes within the transaction INSERT INTO employees (name, age) VALUES ('Emily', 35); UPDATE products SET price = 60.00 WHERE category = 'Electronics'; COMMIT;</pre>
